

Craft Mountain – Toast → GHL Member Benefits

Sep 26, 2026 · @Manam Pervez

Overview

Craft Mountain members get monthly perks (free pour, 50% off a 4-pack) that reset on the 1st with no rollover. This project tracks each redemption automatically: Toast sends the order, n8n identifies the perk and the member, and GHL/Archimedes records it.

Toast does not share guest name, email or phone on in-store orders (confirmed by Toast Support). The member is therefore identified by their **mug number typed as the tab name**.

1. Member orders their free beer at the bar.
2. Bartender rings in the benefit item (e.g. "Free Monthly Pour") and types the mug number (e.g. 037) as the tab name.
3. Toast sends the order to n8n (`order_updated` webhook).
4. n8n checks the check is closed, finds the benefit item, reads the mug number, and skips duplicates and voids.
5. n8n sends mug number, benefit, month and Toast order ID to GHL.
6. GHL finds member 037 and marks "Free pour used – September"; a second use in the same month or an unknown mug number triggers an alert.
7. On the 1st of each month, all perks reset to Available.

What we already have

The order pipeline and redemption logic are built and tested; only member identification is missing.

Item	Status	Notes
Toast Standard API access	Done	Credentials <code>ghl_toast</code> (orders, menus, guest scopes)

Item	Status	Notes
Toast webhook (order_updated)	Done	Live, receiving every order; will be repointed to n8n
Benefit item GUIDs	Done	Initial Member Pour 9b216070... , 50% off 4-Pack c88b437d...
Membership item GUIDs	Done	MUG CLUB, Mug Club Renew, Mug Club Renew (same mug)
Order parsing logic	Done	Closed checks only, skips voids, reads tabName and businessDate
Redemption logic	Done	Redeem / duplicate (Toast re-sends) / double redemption in same month
GHL benefit fields	Done	Period, Status, Redeemed Date, Toast Order ID, Reset Date (Free Pour and 4-Pack)
GHL redemption branches	Done	Field updates, notes, double-redeem tag and alert
Toast Guestbook export	Done	3,334 guests; contact data only, no link to orders
Toast Support answer	Done	No guest contact info on in-store orders under Standard API

What we need from the client

The build can finish once Doug provides the items below; the staff rule is the key dependency.

Toast setup

- ☐ Create a \$0 "Free Monthly Pour" item, or confirm "Initial Member Pour" is the monthly pour
- ☐ Confirm or create the mug pricing (24oz at 16oz) and 10% merch benefits, with their names
- ☐ Tell us if any benefit item appears on more than one menu
- ☐ Make sure staff can enter a tab name on quick bar orders (tab name prompt or Rename check)

Member data

- ☐ Member list: name, email, phone, mug number, tier, active or expired
- ☐ Confirm every member has a unique mug number, and its format (e.g. 037)
- ☐ Access to the GHL/Archimedes sub-account where members live

Business rules

- ☐ Which perks are once per month and which are unlimited
- ☐ Double redemption: alert only, or charge? Who receives alerts, and how (email, SMS, Slack)
- ☐ Unused-perk reminders: yes or no, channel and timing
- ☐ What to do if an expired member redeems a perk

Staff and testing

- ☐ Approve and train the rule: every benefit order gets the mug number as the tab name
- ☐ Name one person to fix unmatched-order alerts
- ☐ A 15-minute test at the bar and a go-live date (ideally the 1st of a month)

Project plan

Five phases; phases 2–4 take about 2–3 working days once the client inputs arrive.

Phase	Tasks	Owner
1. Client inputs	Items in the checklist above; staff rule approved	Doug
2. Toast setup	Benefit items confirmed, tab-name prompt on, webhook repointed to n8n	Doug + Aniya
3. n8n workflow	Receive webhook, verify signature, filter closed checks, dedupe by order ID, detect benefit, read mug number, send to GHL	Aniya
4. GHL / Archimedes	Mug Number field and member import, find member, mark perk used, double-redeem and no-match alerts, monthly reset on the 1st, optional reminders	Aniya
5. Test and launch	Bar test of each perk, double redemption and bad mug number; staff cheat sheet; go live on the 1st	Doug + Aniya

Limitations and future options

The mug-number approach works today but depends on staff typing it every time.

- **Missed or mistyped mug number:** the order cannot be matched; staff get an alert and fix it manually.
- **Double pours are detected after the fact:** the bartender cannot see perk status in Toast, so a second pour is flagged, not blocked.
- **Phase 2 – QR check-in:** the member scans a code, GHL confirms the perk is available and shows the bartender "OK to pour". It blocks double pours up front and needs no Toast guest data, so it suits the Membership Benefit Engine for other breweries.
- **Guest data access:** only via a Toast plan upgrade (RMS PRO, Guest Data API) or the Toast Partner Program; worth considering if Archimedes is sold to many breweries.
